Klac city

- Articulated bottom facilitates the ejection of earth (can be blocked if necessary)
- Quiet thanks to the shock absorbers
- Possible reduced widths possibilities, from 210 mm
- Notched profile adapted to the clearance of pipes

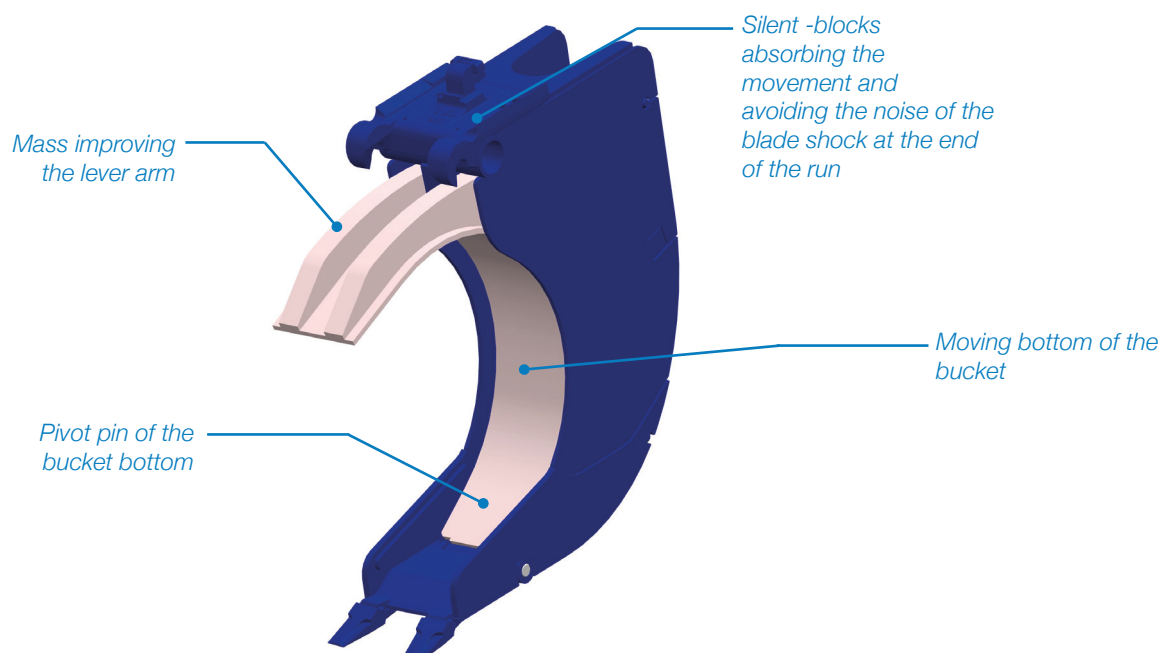

THE TOWN BUCKET

Klac city is the ideal complement to the Klac marguerite. The specificity of urban construction sites is the presence of cables and other pipes, not always easy to locate.

The solution is the Klac city ! An accessory which allows a narrow trench while providing a clever solution to earth jam problems!

All this with an interesting capacity and an operating mode which does not endanger the existing pipes.

TECHNICAL FEATURES

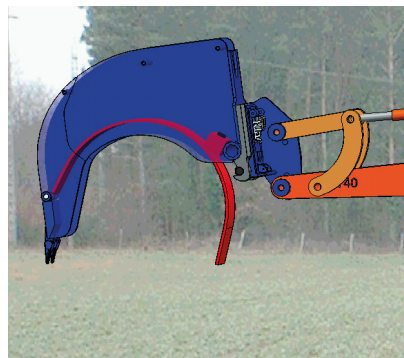

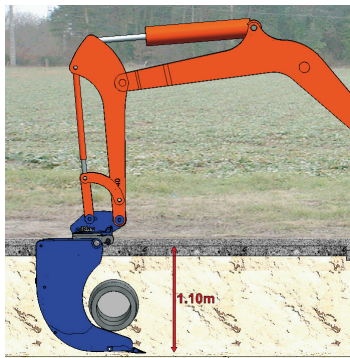

FOCUS ON How it works

Technically, the Klac city looks like an ejector bucket without an ejector blade!

It's actually the bottom of the bucket which moves thanks to the pin located behind the blade.

The free rocking of the bottom of the bucket allows the earth to escape.

Silent blocks absorb the movement and avoid the noise of the blade at the end of the run.

- ✓ The recessed profile allows working under the pipes

- ✓ The movable bottom facilitates evacuation of the earth

The Klac city model F (6 to 12 tonne machines) can reach a depth of 1.10 m (up to the quick hitch or machine's arm).
